

Urgent – Marine Weather Message

High Surf Advisory

Antigua and Barbuda Meteorological Services

10:20 am Tuesday 07 March 2023

...High surf advisory goes into effect Wednesday for Antigua, Barbuda, Anguilla and the British Virgin Islands...

...High surf advisory will be required for the rest of the area by Thursday evening...

...High surf warning is likely for some areas...

Locations to be affected: Reefs and exposed northeast coastlines with relatively shallow, gently to moderately sloping, nearshore areas.

Timing: Wednesday morning until Tuesday.

Synopsis: Moderate long-period swells are expected to reach the area and affect mainly the northern coastlines. The threat level to the life, livelihood, property and infrastructure of those using the affected coastlines is forecast to rise to moderate to high. These swells could cause life-threatening surfs and rip currents on affected coastlines. A high surf advisory means that dangerous surfs of 2 to 3 metres or 6 to 10 feet will affect some coastlines in the advisory area, producing hazardous conditions.

Seas (significant wave heights): 1.5 to 2.7 metres (5 to 9 feet), occasionally or locally reaching near 3.5 metres (11 feet). Swell period: 10 to 15 seconds. **Swells:** Northeast at 1.5 to 2.7 metres (5 to 9 feet) and occasionally higher. The highest seas will likely take place Thursday night and Friday when a warning is also likely.

Surfs (breaking swells): Over 2 metres (over 6 feet). These conditions are conducive for dangerous rip currents. Please note that surfs could be as much as twice the height of swells, depending on the bathymetry of the nearshore areas.

Coastal flooding: High tides combined with onshore wind and swell actions could result in localized coastal flooding and beach erosion.

Potential Impacts: Loss of life—strong currents that can carry even the strongest swimmers out to sea; injuries to beachgoers; beach erosion; sea water splashing onto low-lying coastal roads; beach closures; localized disruptions to marine recreation and businesses; financial losses; damage to coral reefs; saltwater intrusion and disruptions to potable water from desalination. High surfs can knock spectators off exposed rocks and jetties.

Precautionary: Beachgoers, especially to the mainly affected coastlines, should be extremely cautious; bathe only where lifeguards are present or on the sheltered, less affected beaches, mainly to the south. Extreme caution is also required by those using the affected non-beach or rocky coastlines.

Rip currents are powerful channels of water flowing quickly away from shore, which occur most often at low spots or breaks in the sandbar and near structures such as groins, jetties and piers. If caught in a rip current, relax and float. Don't swim against the current. If able, swim in a direction following the shoreline. If unable to escape, face the shore and call or wave for help.

Please continue to monitor these hazardous, life-threatening marine conditions. Stay tuned to updates coming out of the Meteorological Office via antiguamet.com, twitter.com/abmetervice and facebook.com/abmetervice. Also, stay tuned to ABS Radio and TV along with other media platforms for updates.
